

Meetup App

App Description:

Our meetup app will provide our users with cool places to visit and learn more about, it will provide the address, image and a brief description of all the meetup spots.

App Clients

Our app will basically be open to two type of clients a visitor and a user,

1. Visitors will be allowed to and new meetup spots only as we aim to add new meetup places as we plan to increase options available to are users.
2. Users will have the privilege of viewing existing meetup, add meetups and and even select their favorites meetup.

App composition

Our app will consist of a front end and back-end.

1. Front-end , in our front-end we will using react library to render our components . This will include the html and css languages,
2. Backend-end as we know its our server and database and in this part will be using the firebase from google.

Purpose of our App

In this section we will demonstrate the use of

1. React hooks
2. React context
3. React routs
4. Redux
5. Css modules

In the front-end

Purpose of our App

In the back-end we are going to use

1. Create a rest api
2. Apply some http methods(Post, Delete)
3. Set authentication for the app.
